

Computational Fluid Dynamics (CFD) For JLOTS Applications

JLOTS Symposium 2004

27 – 29 Jan 04

Duck, NC

Erick T. Huang, Ph. D., P. E.

Code 31, NFESC, Port Hueneme, CA

(805) 982-1256; erick.huang@navy.mil

- Accuracy
- Completeness
- Cost Reduction

NAVAL FACILITIES ENGINEERING SERVICE CENTER

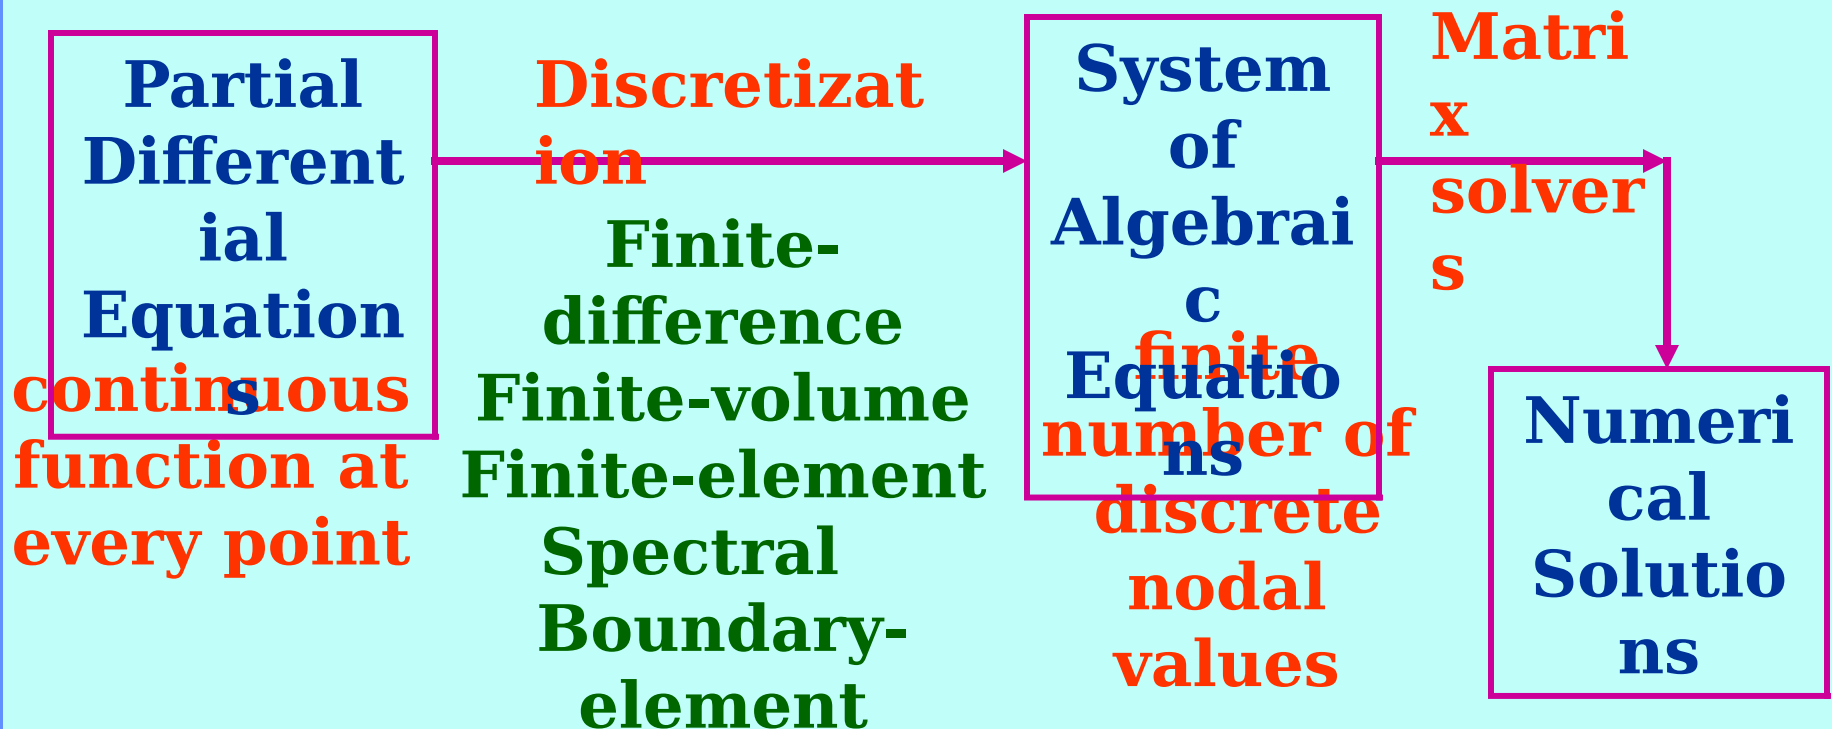

Fluid Mechanics

- Theoretical Fluid Dynamics
- Experimental Fluid Dynamics (EFD)
 - Wind tunnels
 - Towing tank, wave tank, & hydraulic model
 - Field experiments
- Computational Fluid Dynamics (CFD)
 - Numerical algorithms, Computers, Graphics, Animations

Overview of CFD

**Discretization - Numerical
Methods Auxiliary
(initial/boundary) conditions**

CFD model at NFESC

- RANS: Chimera, RANS viscous flow solver
- CHAMPS: Chimera Potential flow solver
- COSMA: 3D, multi-body, fully coupled motion analyzer
- Utility routines:
 - GRIDGEN (numerical grid generator, commercial code)
 - PEGSUS (data management code, USAF)
 - TECPLOT (image processor, commercial code)

Chimera RANS Solver

- Unsteady Compressible/Incompressible Navier-Stokes Equations
- Curvilinear, Moving Coordinate System
- Chimera Domain Decomposition
- Extensive turbulence models
- Multiblock, Multigrid Flow Solver
- Interactive GRIDGEN for Composite Grids
- Embedded, Overlapped, or Matched Grids
- Automatic regridding for Moving Grids
- PEGSUS Interpolation for Composite Grids

CHAMPS

CHimera finite-Analytic Method for Potential-flow
Solver

- » Laplace equation for velocity potential
- » Curvilinear, moving coordinate system
- » Chimera domain decomposition
- » Finite-analytic method
- » Nonlinear free surface boundary conditions
- » Data management for maximum flexibility

Chimera Grids

boundary condition

Why CFD ?

- Accuracy, completeness, & details
- Safety concerns
- Physical restraint
- Non-existence entities
- Complex system in congested water
- Uncharacteristic application
- Information expansion
- Cost, schedule, or facility constraints

Vortex Shedding and Vortex-Induced

Validation 1

Wave induced vorticity around a rectangular cylinder

Validation 2a: flow pattern

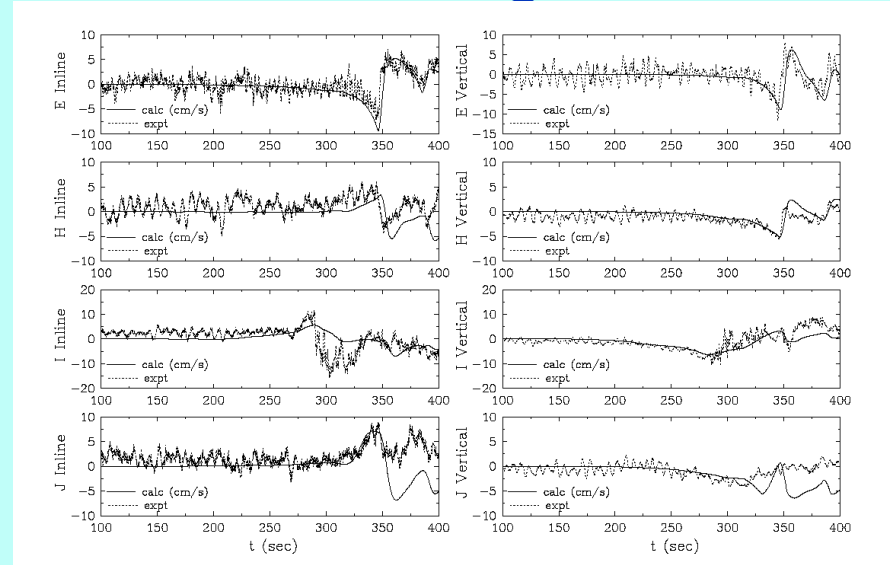

Validation 2b: Currents and berthing loads

Test site and test layouts

Comparison of ship induced velocities

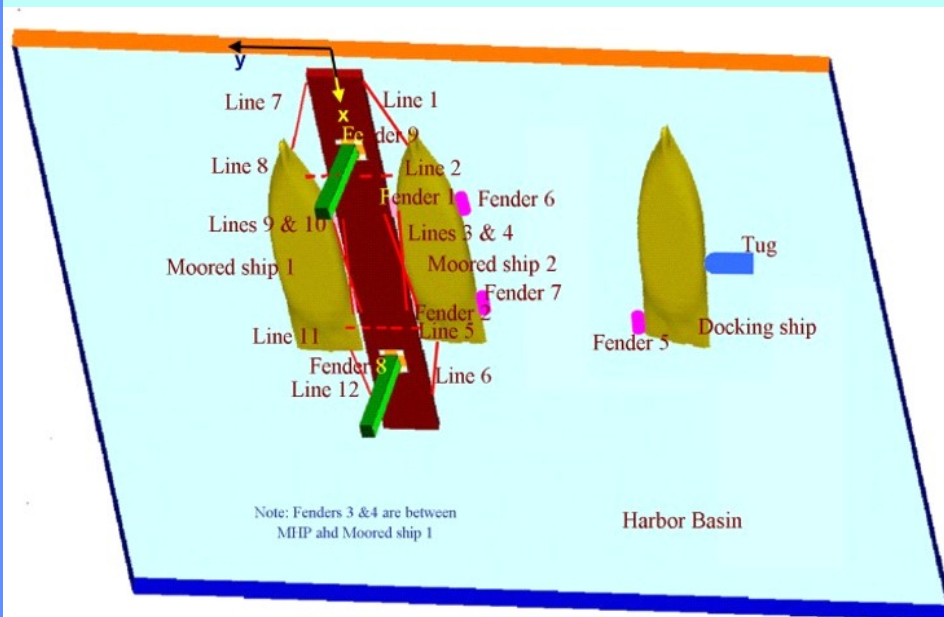

Fender loads and hydrodynamic forces

Comparison of fender loads

Ship operations at a floating pier

Free Decay

Purposes:

- Quantify dynamic characteristics of MHP: resonant frequency & damping
- Explore the influence of vicinity structures to the motion characteristics of MHP

Validation 3: Free decay/Natural frequency

Case ID	ω_* (in the air) Undamped frequency			$\omega_d = \omega_* \cdot \sqrt{1 - \eta^2}$ theory (Equation xx)			ω_d Simulated frequency			η Damping coefficient (Equation xxxx)		
	Surge	Sway	yaw	Surge	Sway	yaw	Surge	Sway	yaw	Surge	Sway	yaw
Case A	0.609	0.609	0.618	.609	.607	.617	.603	.607	.610	.0004	.0730	.0562
Case B	0.609	0.609	0.618	.609	.607	.617	.602	.604	.606	.0004	.0786	.0529

Hull and free surface pressure distribution: MHP + 2 ships

Hull and free surface pressure distribution: MHP + 3 ships

Provides a complete system description in detail

(in time domain throughout entire simulation duration)

Fluid

- Pressure
- Velocity (u, v, w)
- Density
- Vorticity
- Turbulence
- Surface waves

Ship/Structure

- Fluid forces
- Ship/Structure behaviors
- Relative motions
- Coupling forces
- Mooring reactions
- Overtopping/Green water

CASE:LHD05

1SM_C5A8a

Water depth:28
feet

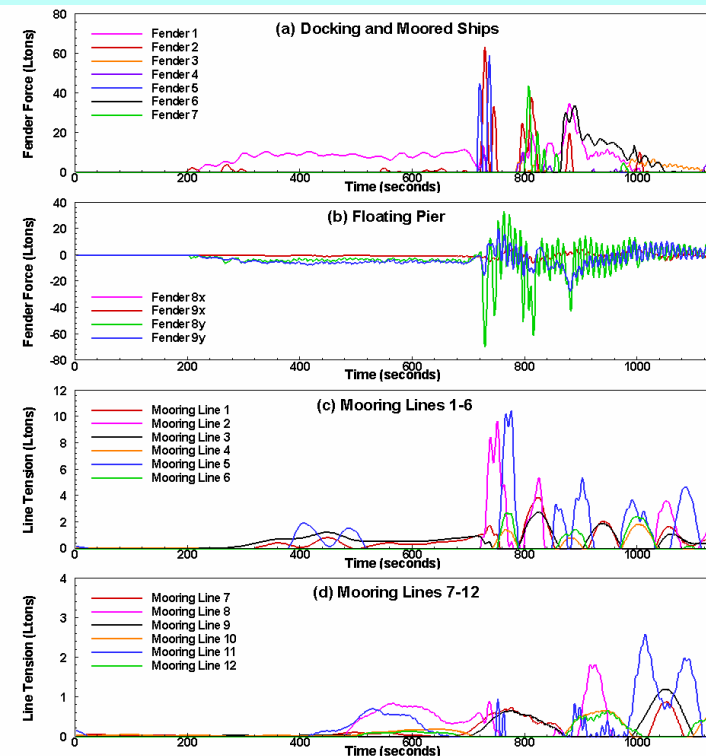

Current spd:
2.3 fps

- pressure
- velocity
(u,v,w)
- density
- vorticity
- turbulence

Vessel motions

Coupling forces

Parameters explored

- Ship layouts
- Pier layouts
- Berthing procedures
- Coupling layouts
- Mooring features
- Water depths
- Tug thrust
- Current speeds
- Wind forces

Stability test - Fy96

Test parameters

Type: Froude model

Waves: Swell 3-12 ft at 5-12 sec

Scale: 1/8 scale of ACBL

Storm SS4 - SS5

Scope: stability threshold

Heading: 0, 45, 90 deg.

Draft: 4 and 6 feet

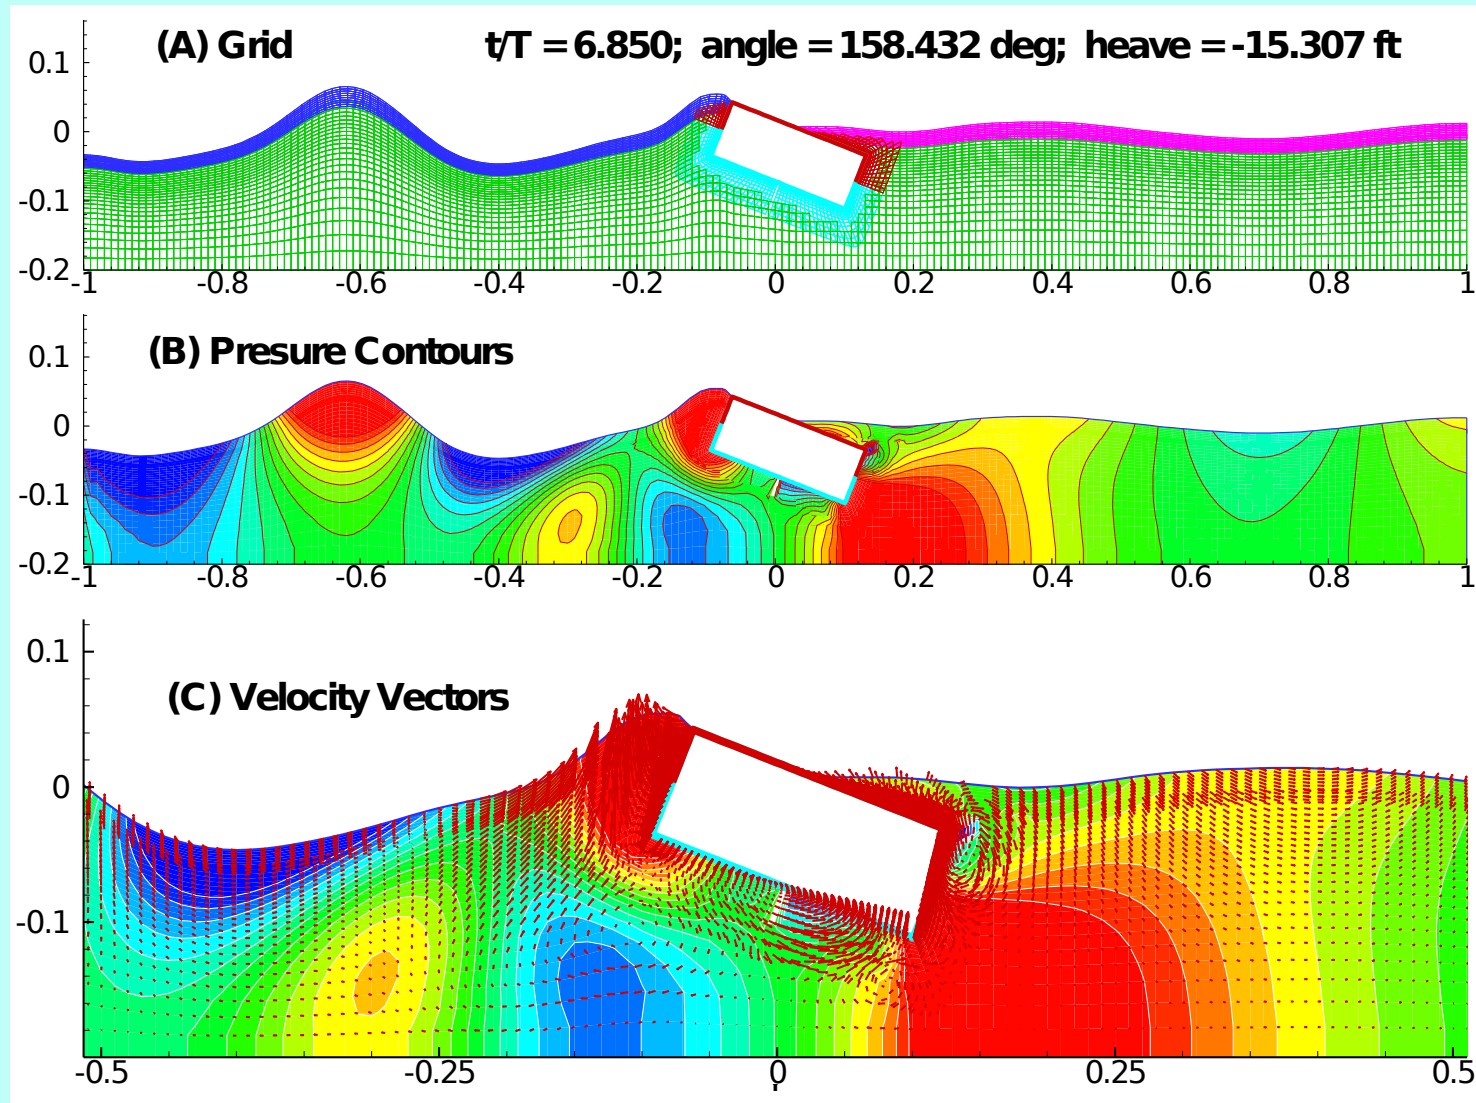

nonlinear factors C. G. : 9.13-11.30 ft above baseline

Summary

CFD simulation

- complements experimental and theoretical fluid dynamics
- provides high-fidelity, high-resolution insights
- addresses non-existence entities
- handles non-reproducible conditions
- pertains to the entire life cycle of a system
- reduces total ownership cost

Consider viscous codes if any of the following exists.

- shallow water
- transverse motion/Beam currents
- heavily coupled multi-body system

Q&A:
